1.3	Floating Point Arithmetic	2
1.3.1	Degrading Error	2
1.3.2	Catastrophic Cancellation	3

1 Error

1.1 Approximation

Let x be an exact number.

Let y be an approximation of x .

Def: The absolute error is $|x - y|$.

Def: The relative error is $\frac{|x - y|}{|x|}$,

1.2 Round-off Error

Usually a machine uses a finite amount of memory to store a number.

machine $\leftarrow \pi$

Suppose a machine can store some number of digits.

1. Allocate a digit for sign, positive or negative.

2. Allocate a number of digits for the mantissa.
3. Allocate a digit for sign of the exponent.
4. Allocate a number of digits for the exponent.

Under rounding in the case of a 4 digit mantissa, $\pi = 0.3142 \cdot 10^1$, this is the machine # representation of pi.

Def: Round-off error are all errors arising from the error between actual # and machine #.

Notation:

$$\begin{aligned} x &= \text{real \#} \\ fl(x) &= \text{machine \# representation of } x \end{aligned}$$

In an s-digit rounding machine,

$$\text{Abs error} = |x - fl(x)|$$

$$\text{Rel error} = \frac{|x - fl(x)|}{|x|} \leq \frac{1}{2} \cdot 10^{1-5} = 5 \cdot 10^{-5}$$

1.3 Floating Point Arithmetic

What happens under arithmetic operations? (+, -, ·, /)

Two things to watch out for:

1. Many operations can degrade error.
2. Catastrophic cancellation.

1.3.1 Degrading Error

number	machine
x	$fl(x)$
y	$fl(y)$
$x + y$	$fl(fl(x) + fl(y))$

The more nested $fl()$ there are, the larger the error will be. The same follows for -, ·, /.

When performing arithmetic, it temporarily allows for more digits than the mantissa allows.

Algorithmic "solutions"

$$((x + y) + z) + w$$

Worst case, 4 times the error.

$$(x + y) + (z + w)$$

Worst case, 3 times the error.

1.3.2 Catastrophic Cancellation

Ex: 3-digit rounding machine. Given 2 numbers: 0.312 and 0.311.

$$0.312 - 0.311 = 0.001 = 0.1 \cdot 10^{-2}$$

Loss of significant digits!

Ex: 5-digit rounding machine. Given 2 numbers:

$$x = 0.41626324$$

$$y = 0.41626323$$

$$x - y = 0.00000001$$

In machine:

$$fl(x) = 0.41626$$

$$fl(y) = 0.41626$$

$$fl(x) - fl(y) = 0.00000 = 0$$

$$fl(fl(x) - fl(y)) = 0$$

Relative error:

$$\begin{aligned} \frac{|x - y - fl(fl(x) - fl(y))|}{|x - y|} &= \frac{|x - y - 0|}{|x - y|} \\ &= 1 = 100\% \text{ error!} \end{aligned}$$
